

Beetle Blaster #BB-1

Small Hive Beetles, if not controlled, can create a terrible mess in a hive. A strong colony of bees can often keep the beetle population in check. The bees will chase the beetles around preventing them from laying eggs. The beetles in turn seek dark crevasses in which to hide from the bees. The Beetle Blaster provides the perfect hiding place for the beetles and prevents them from leaving. Beetle Blaster is a non-chemical, disposable trap which is placed at the top of the hive, between the frames. The beetles attempt to hide in the trap. Once they enter the trap through slots the beetles are trapped in vegetable oil and are usually unable to escape. The trap comes as one piece. The top part, which has slots, rest on the top of the frames, preventing the trap from falling through the hive. The bottom part contains the vegetable oil and hangs between the top bars of the frame. More than one trap may be used between frames, depending on the level of infestation and the size of the hive. Once the trap is full or no longer needed, simply dispose of it.
